

GIVI scales on CT Scanner machine

Since not long time we are providing our magnetical scales in a new application: CT Scanner / Body Computed Tomography multislice scanner.

It's a huge market, Surgery and Health Care machines, and there are manufactures all over the world, not only the big company that are making the high quantity machine, but also small company that are providing the specials versions (i.e.: for single part of the body - Heart, brain - or even for animals and so on). In this kind of application, our products are appreciated for easy installation, performance, reliability and price.

The main names are:

Hitachi
Philips
Newsoft
Toshiba
Ronti
Siemens
Clarix
General Electric

In these applications, the manufactures are looking for a hi grade control of the movement of the bed where the patient is held. As the market and the technology are going to be more and more accuracy, in this kind of inspection they need a very hi level measurement control. At the same time, these machines should be as small as they can, easy to install and with very hi reliability.

They can find in our magnetical solution, AGM sensor (absolute version) or MTS/MTV (incremental version), with resolution 0.01 mm and accuracy +/- 0.015 mm, a very easy to install and cost effective solution.

As usual, don't hesitate to contact me for special technical or commercial request. Let's do it together!
